

# pst-blur package

## version 2.0

Martin Giese\* and Herbert Voss†

2005/09/08

## 1 Introduction

The ability to paint shadows on arbitrary shapes is a standard feature of PSTricks. However, these shadows are always ‘hard’:

The `pst-blur` package provides blurred shadows for closed shapes drawn with PSTricks:

It also provides a new box command `\psblurbox`, which is similar to `\psshadowbox`, but gives the box a blurred shadow.

The new graphics parameters and macros provided by the package are described in section 2 of this document. Section 3, if present, documents the implementation consisting of a generic  $\text{\TeX}$  file and a PostScript header for the `dvi-to-PostScript` converter. You can get section 3 by calling  $\text{\LaTeX}$  as follows on most relevant systems:

```
latex 'AtBeginDocument{\AlsoImplementation}\input{pst-blur.dtx}'
```

---

\*giese@ira.uka.de

†voss@pstricks.de

## 2 Package Usage

To use `pst-blur`, you have to say

```
\usepackage{pst-blur}
```

in the document prologue for L<sup>A</sup>T<sub>E</sub>X, and

```
\input pst-blur.tex
```

in “plain” T<sub>E</sub>X.

**blur** To paint shapes with blurred shadows, set the graphics parameters **shadow** and **blur** to **true**, eg

```
\psset{unit=1cm}
\pscircle[shadow=true,blur=true](0,0){0.5}
```

for a circle with a blurred shadow. The parameter **blur** has no influence if **shadow** is **false**.

**shadowsize** The rendering of blurred shadows is controlled by a number of additional graphics parameters. The offset of the shadow is controlled by the parameters **shadowangle** and **shadowsize**, which are the same as for ordinary shadows.<sup>1</sup>  
**blurradius** The size of the blurring effect is controlled by the parameter **blurradius**, see Fig 1. The default value for **blurradius** is 1.5pt, which fits nicely with the default **shadowsize** of 3pt.

**shadowcolor** The inner, usually darkest part of the shadow is painted in the colour defined by **shadowcolor**. In the range defined by **blurradius**, the colour gradually fades to the background colour set by **blurbg**. The default value for **blurbg** is white. You should change this parameter when you want to paint shapes over a coloured background, ie

```
\psframe[fillstyle=solid,fillcolor=yellow](-.7,-.7)(.7,.7)
\pscircle[shadow=true,blur=true,blurbg=yellow](0,0){0.4}
```

**blursteps** The number of distinct colour steps painted between **shadowcolor** and **blurbg** is controlled by the parameter **blursteps**. The default value for **blursteps** is 20, which is usually more than sufficient. Note, that higher values for **blursteps** result in proportionally slower rendering. This can be very tiresome with complex shapes.

**\psblurbox** Using a `\psframebox` with a blurred shadow in the middle of some text produces poor results, because T<sub>E</sub>X does not know about the extra space taken

<sup>1</sup>In particular, **shadowangle** has to be negative for the usual placement of shadows below and to the right of shapes.

Figure 1: Parameters for blurred shadows

by the shadow. For normal shadows, this problem is solved by the `\psshadowbox` macro, which adds the extra space around the box for the shadow. For blurred shadows, this is not sufficient: an extra `\blurradius` has to be added. This is done by the macro `\psblurbox`, which is otherwise identical to `\psshadowbox`. Note, that `\psblurbox` shares a deficiency of `\psshadowbox`: It only works correctly with `shadowangle = -45`, because  $\text{\TeX}$  does not provide trigonometric operations.

### 3 The Code

#### 3.1 The `pst-blur.sty` file

The `pst-blur.sty` file is very simple. It just loads the generic `pst-blur.tex` file.

```

1 <*stylefile>
2 \RequirePackage{pstricks}
3 \ProvidesPackage{pst-blur}[2005/09/08 package wrapper for
4   pst-blur.tex (hv)]
5 \input{pst-blur.tex}
6 \ProvidesFile{pst-blur.tex}
7   [\filedate\space v\fileversion\space 'PST-blur' (hv)]
8 </stylefile>

```

#### 3.2 The `pst-blur.tex` file

`pst-blur.tex` contains the  $\text{\TeX}$ -side of things. We begin by identifying ourselves and setting things up, the same as in other PSTricks packages.

```

9 <*texfile>
10 \csname PstBlurLoaded\endcsname
11 \let\PstBlurLoaded\endinput
12 \ifx\PSTricksLoaded\endinput\else
13   \def\next{\input pstricks.tex }\expandafter\next
14 \fi

pst-blur uses the extended version of the keyvalue interface.

15 \ifx\PSTXKeyLoaded\endinput\else\input pst-xkey \fi
16 \def\fileversion{2.0}
17 \def\filedate{2005/09/08}
18 \message{ v\fileversion, \filedate}
19 \edef\TheAtCode{\the\catcode'\@}
20 \catcode'\@=11

```

Add the package name to the list of family names of the keyvalue list.

```

21 \pst@addfams{pst-blur}
22 \pstheader{pst-blur.pro}

```

### 3.2.1 New graphics parameters

<pre> blur blurradius blursteps blurbg </pre>	<p>The definitions of the new graphics parameters follow the definitions for parameters of the same types found in <code>pstricks.tex</code>.</p> <pre> 23 \newif\ifpsblur 24 \define@key[psset]{pst-blur}{blur}[true]{\@nameuse{psblur#1}\pst@setrepeatarrowsflag} 25 \psset{blur=false} 26 %% 27 \define@key[psset]{pst-blur}{blurradius}{\pst@getlength{#1}\psx@blurradius} 28 \psset{blurradius=1.5pt} 29 %% 30 \define@key[psset]{pst-blur}{blursteps}{\pst@getint{#1}\psx@blursteps} 31 \psset{blursteps=20} 32 %% 33 \define@key[psset]{pst-blur}{blurbg}{\pst@getcolor{#1}\psx@blurbg} 34 \psset{blurbg=white} </pre>
---	---

### 3.3 Hooking into the PSTricks shadow macros

<pre> \pst@closedshadow </pre>	<p>The macro <code>\pst@closedshadow</code> is usually called internally by PSTricks to paint a shadow in the shape of the current path. This macro has been renamed <code>\pst@sharpclosedshadow</code>. The new <code>\pst@closedshadow</code> jumps to either of <code>\pst@sharpclosedshadow</code> or <code>\pst@blurclosedshadow</code>, depending on <code>\ifpsblur</code>, which is directly related to the graphics parameter <code>blur</code>.</p>
--------------------------------	--

```

35 \def\pst@closedshadow{%
36 \ifpsblur\pst@blurclosedshadow\else\pst@sharpclosedshadow\fi
37 }
38 \def\pst@sharpclosedshadow{%
39   \addto@pscode{%
40     gsave

```

```

41 \psk@shadowsize \psk@shadowangle \tx@PtoC
42 \tx@Shadow
43 \pst@usecolor\psshadowcolor
44 gsave fill grestore
45 stroke
46 grestore
47 gsave
48 \pst@usecolor\psfillcolor
49 gsave fill grestore
50 stroke
51 grestore}}

```

`\pst@blurclosedshadow` The PostScript code for blurred shadows is produced by the following macro. It pushes the diverse parameters (`\tx@PtoC` does polar to cartesian coordinate transformation for the shadow offset) and calls `BlurShadow`. Afterwards, it fills and strokes the current path, same as the original `\pst@closedshadow`.

```

52 \def\pst@blurclosedshadow{%
53 \addto@pscode{%
54 gsave
55 gsave \pst@usecolor\psshadowcolor currentrgbcolor grestore
56 gsave \pst@usecolor\psx@blurbg currentrgbcolor grestore
57 \psx@blurradius\space
58 \psx@blursteps\space
59 \psk@shadowsize \psk@shadowangle \tx@PtoC
60 tx@PstBlurDict begin BlurShadow end
61 grestore
62 gsave
63 \pst@usecolor\psfillcolor
64 gsave fill grestore
65 stroke
66 grestore}}

```

`\pst@blurclosedshadow` This one looks very impressive. In fact, it is a verbatim copy of `\psshadowbox`, with only the line `\advance\pst@dimh\psx@blurradius\p@` added!

```

67 \def\psblurbox{%
68 \def\pst@par{}\pst@object{psblurbox}}
69 \def\psblurbox@i{\pst@makebox\psblurbox@ii}
70 \def\psblurbox@ii{%
71 \beginngroup
72 \pst@useboxpar
73 \psblurtrue
74 \psshadowtrue
75 \psboxseptrue
76 \setbox\pst@hbox=\hbox{\psframebox@ii}%
77 \pst@dimh=\psk@shadowsize\p@
78 \pst@dimh=.7071\pst@dimh
79 \advance\pst@dimh\psx@blurradius\p@
80 \pst@dimg=\dp\pst@hbox
81 \advance\pst@dimg\pst@dimh

```

```

82 \dp\pst@hbox=\pst@dimg
83 \pst@dimg=\wd\pst@hbox
84 \advance\pst@dimg\pst@dimh
85 \wd\pst@hbox=\pst@dimg
86 \leavevmode
87 \box\pst@hbox
88 \endgroup}
89 %%
90 \catcode'\@=\TheAtCode\relax
91 </texfile>

```

### 3.4 The pst-blur.pro file

The file `pst-blur.pro` contains PostScript definitions to be included in the PostScript output by the dvi-to-PostScript converter, eg `dvips`. This is all rather similar to `pst-slpe.pro`, and I just don't feel like explaining it, so you'll have to work through it yourself, if you want to know what happens. The trick is basically to draw the outline repeatedly with varying line widths. The procedure `Shadow` called in `BlurShadow` is defined in `pstricks.pro` and translates the current path based on an  $x$ - and  $y$ -displacement taken from the stack.

```
