catcodes

"Generic" Switching of Category Codes

Uwe Lück*

November 7, 2012

Abstract

The catcodes bundle provides small packages for switching category codes, usable both with LATEX and without. (i) stacklet.sty maintains stacks for "private letters," needed for plainpkg.tex's minimal framework for "generic" packages. (ii) actcodes.sty deals with "active characters," switching their category codes and assigning meanings to "active-character tokens." (iii) catchdq.sty uses the "ASCII double quote" as an active character for simplified access to typographical double quotes.— These packages are "generic" in the sense that they should be usable at least both with LATEX and Plain TEX, based on plainpkg.tex.

Required Packages: plainpkg, stacklet

 ${\bf Related\ Packages:}\quad {\sf catoptions},\ {\sf pcatcode\ from\ amsrefs},\ {\sf texapi},\ {\sf csquotes}.$

Keywords: Macro programming, category codes, private letters, active characters, double quotes

1 Overview

Sorry, ..., the abstract and the table of contents must suffice for today (2012-11-07) ${\tt TODO}$

2 Shared Features of Usage

All the packages of the bundle are "plainpkg packages" in the sense of the $\mathsf{plainpkg}^1$ documentation that exhibits details of what is summarized here. Therefore:

 $^{^{1}\}mathtt{ctan.org/pkg/plainpkg}$

- All of them require that TFX finds plainpkg.tex as well as stackrel.sty.
- In order to load \(\langle catcodes \rangle \). sty \(\text{where } \langle catcodes \rangle \) is stacklet, actcodes, or catchdq), type \[\underset \text{usepackage} \langle \langle catcodes \rangle \rangle \] in a "plainpkg package", or \[\underset \text{catcodes} \rangle \]. or perhaps \\ input \langle \langle catcodes \rangle \right. sty\rangle?

3 actcodes.sty—Active Characters

3.1 Introduction

Active characters can simplify syntax often, i.e., the code may be very pleasant to type and read. But sometimes something may fail. See Section 3.3.2 for how to cope with possibilities and difficulties.

3.2 Package File Header—plainpkg and Legalese

```
\input plainpkg
    \ProvidesPackage{actcodes}[2012/11/07 v0.2a active characters (UL)]

    %%
18
```

3.3 Purpose and Usage

The package derives from switching category codes in the nicetext and morehype bundles and should improve them.

3.3.1 Installing and Calling

The file actcodes.sty is provided ready, installation only requires putting it somewhere where TeX finds it (which may need updating the filename data base).² However, the files plainpkg.tex and stacklet.sty must be installed likewise.

 $^{^2 \}verb|http://www.tex.ac.uk/cgi-bin/texfaq2html?label=inst-wlcf|$

Without \LaTeX , load it by \input_{\square} actcodes.sty.

As explained in plainpgk-doc.pdf, however, "generic" packages based on plainpkg should load actcodes by \RequirePackage{actcodes}.

3.3.2 Commands and Syntax

actcodes.sty provides [\MakeActive], [\MakeActiveDef], [\MakeActiveDef], [\MakeActiveLet], [\MakeOther], [\MakeActiveOther] with rather obvious syntax—you find more detailed descriptions mixed with implementation below ... TODO —Without \LaTeX , the latter's internal \LaTeX is provided as well.

3.4 The Code

3.4.1 Our Private Letters

19 \PushCatMakeLetterAt

3.4.2 The Core

[\MakeActiveAss\\\ ass-fun\\\\\\ char\\\\\\ ass-args\\] "activates" $\langle char\rangle$ and then applies assignment function $\langle ass-fun\rangle$ with arguments $\langle ass-args\rangle$ to it. The code derives from IATEX's \Osverb and \doOnoligs and was also discussed on the LATEX-L mailing list September 2010 (Will Robertson; Heiko Oberdiek). The present definition generalizes \MakeActiveDef and \MakeActiveLet of my earlier packages.

- 20 \gdef\MakeActiveAss#1#2{%
- 21 \MakeActive#2%
- 22 \begingroup \lccode'\~'#2\relax \lowercase{\endgroup #1~}}

I was reluctant to provide $[\mbox{\constraint} Active \color= \color$

23 \gdef\MakeActive#1{\catcode'#1\active}

 \dots it just "revives" the meaning that the corresponding active-character token last time \dots

$3.4.3 \setminus def and \setminus let$

 $\MakeActiveDef \char \$

24 \quad \qua

W.r.t. the definition of this \MakeActiveDef, Heiko Oberdiek remarked that it allows *macro parameters*, as opposed to my earlier definition in fifinddo. Without parameters, this kind of macro has been used for conversion of text encodings (atari.fdf, and I thought this was the idea of stringenc ...).

 $\lceil \text{MakeActiveLet} \ \langle char \rangle \langle cmd \rangle \rceil$ has been provided in niceverb so far. The present package has been made in order to have $\ \text{MakeActiveLet}$ with blog.sty as well, it was too annoying to use $\ \text{MakeActiveDef}$ there so often.

25 \gdef\MakeActiveLet{\MakeActiveAss\let}

3.4.4 Switching Back ...

\fi

28

Sometimes, the "active" behaviour of $\langle char \rangle$ is too difficult, and you may want to switch bach to its "simple" way ... This may work by $[\mbox{MakeOther} \mbox{\char}]$... with $\mbox{\colored}$... WakeOther just is $\mbox{\colored}$ is $\mbox{\colored}$...

```
26 \ifltx \global\let\MakeOther\@makeother
27 \else \gdef\MakeOther#1{\catcode'#112\relax}
```

But within a macro (or other) argument, you can't change the \catcode. (I lost some time by not realizing that it was within a large argument where I tried to switch the \catcode.) Anyway or in certain cases, it may be better to keep a character "active" throughout a document and just to change the *expansion* of the "active-character token." This can be done with \MakeActiveLet and \MakeActiveDef in certain cases already. E.g., when the "blank space" has been "activated" by \obeylines, \MakeActiveLet_\subset \space "undoes" this half-way, while it does not restore "argument skipping" and "compressing blank spaces."

When character $\langle char \rangle$ should be "active" for some time, but for certain moments you prefer that it behaves like an "other character", you can switch to its "other" expansion by [\MakeActiveOther\\\chickletar\]:

```
29 \gdef\MakeActiveOther#1{%
30 \MakeActiveAss\edef#1{\expandafter\@gobble\string#1}}
```

```
31 \ifltx\else \long\gdef\@gobble#1{} \fi
32 % \show_ \MakeActiveOther\_ \show_ \expandafter\show_
```

I am not providing a version without the \catcode change, although the latter is superfluous here TODO ...

niceverb also provides $[\mbox{MakeNormal}\\char]$, it may migrate to here in the future, and there may be $[\mbox{MakeActiveNormal}\\char]$ extending the above $\mbox{MakeActiveOther TODO}$...

Also, a stack might be used as in stacklet, even to switch meanings of active-character tokens . . . not sure TODO . . .

babel does similar things, but I never have ... TODO

4 catchdq.sty—Typographical Double Quotes

4.1 Introduction

The catchdq package allows getting typographical double quotes by just using the "ASCII double quote" ["]. A more precise overview:

- 2. There are much different conventions especially for *German* and *French*. They require different characters or T_EX commands than for *English*. The packages german, ngerman, and babel have dealt with such conventions.
- 3. Understanding the ideas mentioned before has been difficult for a long time, probably because typewriter and computer *keyboards* never have offered the appropriate keys. Rather, they only offered the "ASCII double quote" that produced an approximation ("neutral quotation marks") *not* making the difference. Many users and readers have not realized the difference, they have not realized how their screen or printer output differed from double quotes in books and newspapers. Cf. the Wikipedia article³
- 4. The idea of the catchdq package is that the user indeed should not worry about that difference and just type "ASCII double quotes", and they should be "converted" into the appropriate typographical quotation marks automatically. This should work by "toggling," i.e., the first "ASCII double quote" is interpreted as "opening," the second as "closing," the next one as "opening" . . . —Word processors have provided this feature (as an option) as well.

 $^{^3}$ en.wikipedia.org/wiki/Quotation mark

- 5. Language-dependency of the feature currently is managed through the langcode package.
- 6. The feature may cause problems sometimes. Therefore, explicit switching the feature "on" and "off" is required.
- 7. The csquotes package addresses the issue in a more comprehensive and perhaps more stable way.

See Section 4.3.2 for additional details.

4.3 Purpose and Usage

4.3.1 Installing and Calling

The file catchdq.sty is provided ready, installation only requires putting it somewhere where TeX finds it (which may need updating the filename data base).⁴ However, the files plainpkg.tex and stacklet.sty must be installed likewise.

With IATEX, the file should be loaded by $\RequirePackage{catchdq}$ or $\uberline{usepackage{catchdq}}$.

Without \LaTeX , load it by $\liminf_{\alpha \to 0} \text{sty}$.

As explained in plainpgk-doc.pdf, however, "generic" packages based on plainpkg should load catchdq by \RequirePackage{catchdq}.

⁴http://www.tex.ac.uk/cgi-bin/texfaq2html?label=inst-wlcf

4.3.2 Commands and Syntax

catchdq.sty (indirectly) allows using $\lceil "\langle no-dqs \rangle " \rceil$ for surrounding $\langle no-dqs \rangle$ with typographical quotation marks, using that double quote $\lceil " \rceil$ as an active character. As rendering that " active during defining macros can corrupt the latter, the user (or package writer) must activate that " explicitly by \catchdqs\.

Further difficulties may arise after \catchdqs, various ways to get around them are described in the remaing sections.

4.4 The Code

4.4.1 Required

The package is an application (of ideas of) actcodes.sty:

60 \RequirePackage{actcodes}

4.4.2 The Core: \catchdq

\catchdq $\langle no\text{-}dqs \rangle$ " will expand to \\dqtd{ $\langle no\text{-}dqs \rangle$ }, provided the ASCII double quote is an active character:

61 {\MakeActive\"\gdef\catchdq#1"{\dqtd{#1}}}

4.4.3 What Double Quotes Actually Are

\dqtd in turn is a kind of "variable." blog.sty offered \endqtd for English typographical double quotes, \dedqtd for German ones, and \asciidqtd for "non-typographical" double quotes (as needed for XML attributes). \asciidq accesses a single ASCII double quote, \endq a single English typographical left one, \end{\endq} a single English typographical right one. (It may be useful to access them indepentently of each other, in certain complex situations ...) blog.sty, dealing with HTML, of course has different ideas about them TODO.

- 62 \gdef\asciidq{"}
- 63 \gdef\asciidqtd#1{"#1"}

We allow loading catchdq *after* another package (such as blog.sty) has chosen meanings for \endqtd and the like (difficult TODO)

- 64 \ifx\enldq \undefined \gdef\enldq{''} \fi
- 65 \ifx\enrdq \undefined \global\let\enrdq\asciidq \fi
- % \ifx\endqtd\undefined \gdef\endqtd#1{\enldq#1\enrdq} \fi

Typographical alternatives to \endqtd may be obtained from ngerman.sty or so, if you are smart ... (see Section 4.4.4 for how it works):

% \ifx\dedqtd\undefined \gdef\dedqtd#1{\glqq#1\grqq} \fi

blog.sty, dealing with HTML, had a different idea about \endqtd of course. It has also used the mechanism of the langcode package that allows using \dqtd and other language-depended constructs with an "implicit" choice according to the "current language code," which should appear soon.

4.4.4 Switching

blog.sty usually does a single switch which gets a new name now: \catchdqs

68 \gdef\catchdqs{\MakeActiveLet\"\catchdq}

After this, $\lceil | \langle no-dqs \rangle | \rceil$ will expand to \dqtd{#1}. The default expansion for \\dqtd will be \\endqtd:

69 \ifx\dqtd\undefined \global\let\dqtd\endqtd \fi

Might be done by $\ensuremath{\backslash} \text{endqs}$ —when there are alternatives, but blog.sty and lang-code.sty do this in a different way ... TODO

- 70 % \gdef\endqs{\let\dqtd\endqtd}
- 71 % \ifx\dqtd\undefined \global\endqs \fi

Actually, here is a little "Tessst" \dots and here with "doytshe doppleta anf \dots " \dots This has been achieved by

\usepackage{ngerman}_\originalTeX

\MakeOther\" may switch off catching mode (—done just before, as niceverb at present doesn't render it verbatim). actcodes suggests a different way to return from the \catchdqs state: Let the character active and change its meaning only, let it expand to its "other" version—by \activeasciidqs? \MakeActiveOther\" and \let"\asciidq (it works!) or \MakeActiveLet\"\asciidq (abbreviate as \activeasciidqs?) ... In blog.sty, there never was a need for switching back. We must rework interaction with niceverb and can perhaps simplify the latter, ... TODO

5 stacklet.sty—Private Letters

5.1 Introduction

"Private letters" here are meant to be characters that belong to the "letter" category only within packages. A package typically provides user commands as well as internal commands, and the latter are characterized by containing funny letters in commands such as \@gobble. This is to avoid conflicts. See Section 5.3.2 for the commands provided.

5.2 Package File Header—plainpkg and Legalese

```

5.3 Usage

5.3.1 Installing and Calling

The file stacklet.sty is provided ready, installation only requires putting it somewhere where TeX finds it (which may need updating the filename data base).⁵ However, the file plainpkg.tex must be installed likewise.

With LATEX, the file should be loaded by \RequirePackage{stacklet} or \usepackage{stacklet}.

Without $L^{A}T_{E}X$, both \input_{\square} stacklet.sty and \input_{\square} plainpkg load stacklet.sty.

 $^{^{5} \}verb|http://www.tex.ac.uk/cgi-bin/texfaq2html?label=inst-wlcf|$

5.3.2 Commands and Syntax

stacklet.sty provides

for getting "private letters" and giving them back their previous category code in package files with or without \LaTeX . As \LaTeX has its own stack for @, there are also

```
| \PushCatMakeLetterAt | and | \PopLetterCatAt |
```

that care for Q's category code without IATEX only.

5.4 The Code

5.4.1 Name Space

Each "private letter" $\langle char \rangle$ gets its own stack, in some name space, determined by $\lceil \text{cat_stack} \rceil$ (\withcsname is from plainpkg.tex):

```
97 \withcsname\xdef cat_stack\endcsname{%

98 \noexpand\string \withcsname\noexpand cat_stack\endcsname

99 \noexpand\string}
```

I.e., ?cat_stack will expand to

?string?cat_stack?string

in the notation of the dowith package documentation.

100 % \withcsname\show cat_stack\endcsname

5.4.2 Pushing

```
\P \PushCatMakeLetter \P Char
```

```
101 \xdef\PushCatMakeLetter#1{%
102 \noexpand\withcsname
103 \withcsname\noexpand pushcat_makeletter\endcsname
104 \withcsname\noexpand cat_stack\endcsname#1\endcsname#1}
105 \%\show\PushCatMakeLetter
106 \withcsname\gdef pushcat_makeletter\endcsname#1#2{%
```

#1 is the stack token, #2 is the "quoted" character. Pushing ...

```
107 \xdef#1{\the\catcode'#2\relax%
```

... the new entry. \relax separates entries, braces instead tend to get lost in popping ... If the stack has existed before, its previous content is appended:

```
108 \ifx#1\relax \else #1\fi}%
```

I thought of storing \catcodes hexadecimally (without braces) using IATEX's \hexnumber, but the latter has so many tokens ... Finally rendering $\langle char \rangle$ a "letter":

109 \catcode'#211\relax}

Now we can use a "private letter stack" for our own package:

110 \PushCatMakeLetter_

5.4.3 Popping

```
111 \gdef\PopLetterCat#1{%

112 \expandafter\expandafter

113 \popcat_\csname\cat_stack#1\expandafter\endcsname

114 \expandafter \end \csname\cat_stack#1\endcsname#1}
```

\popcat_ parses the expansion, assigns the old category code and and stores the reduced stack:

```
\label{local_model} $$115 \qquad \gdef\popcat_#1\relax#2\end#3#4{\catcode'#4#1\gdef#3{#2}}$
```

... check existence? TODO

5.4.4 No @ Stack with LATEX

\PushCatMakeLetterAt is like \PushCatMakeLetter\@ except that it has no effect under IATEX:

\gdef\PushCatMakeLetterAt{\ifltx\else\PushCatMakeLetter\@\fi}

```
\PopLetterCatAt by analogy ...
```

117 \quad \qu

5.4.5 Leaving the Package File

```
... in our new way:
```

- 118 \PopLetterCat_
- 119 \endinput
